Approximate Method for Lateral Load Analysis of High-Rise Buildings. An approximate method for the design of long, high-rise buildings under horizontal wind loading is described. The method is based on the reduction of the framed structure to one built-in column with equivalent bending and torsional stiffnesses.

36.3 Analysis of Building Frames to lateral (horizontal) Loads A building frame may be subjected to wind and earthquake loads during its life time. Thus, the building frames must be designed to withstand lateral loads. A two-storey two-bay multistory frame subjected to lateral loads is shown in Fig. 36.6.

Once the design lateral loads are known on the two-dimensional frames, one could analyze the frame for the member forces. One could carry out an accurate computer analysis or an approximate analysis as per requirement. Approximate analysis is usually performed at preliminary design stage and to assess the computer analysis.

### Approximate Method for Frame Lateral Load Analysis (the Portal Method)

The force for step 0 is a given: don't forget to include the external lateral load of  $100\text{ kN}$ . Step 1 loads are from the portal method analysis, giving the column shears for each column at points f, g, and h (the results of which are shown at the top of the figure).

### 7.3 The Portal Method | Learn About Structures

An approximate method for the design of long, high-rise buildings under horizontal wind loading is described. The method is based on the reduction of the framed structure to one built-in column with equivalent bending and torsional stiffnesses. Discrete actions of the horizontal members on the columns are distributed over the story heights. The floors are treated as rigid in the horizontal ...
