Shin splint anatomy and treatment - Chiropractic Economics

These extraspinal changes consist of hyperostosis at sites of tendon and ligament attachment to bone, para-articular osteophytes, and ligament ossification. Generally in the peripheral skeleton, periosteal spurs arising at the site of osseous attachment of the tendon are more prominent than true calcification of the tendon itself.

DISH and Stenosis - Dynamic Chiropractic

Diffuse Idiopathic Skeletal Hyperostosis (DISH) is a spinal and extraspinal articular disorder characterized by ligamentous calcification and ossification. This entity is distinct from ankylosing spondylitis and degenerative joint disease and occurs with an incidence of 12 percent in the United States, affecting middle-aged and elderly individuals.
