Encoding and Decoding in Python 3. Python 3's str type is meant to represent human-readable text and can contain any Unicode character. The bytes type, conversely, represents binary data, or sequences of raw bytes, that do not intrinsically have an encoding attached to it. Encoding and decoding is the process of going from one to the other:

### **Unicode & Character Encodings in Python: A Painless Guide ...**

In this three-course certificate program, you'll gain a thorough understanding of the major Python libraries as well as practice standard programming styles and idioms. We'll explore different aspects of network-based programming with Python, including web applications, and dig into larger systems development issues and advanced topics.
