The VV pumps are vertical dry pit pumps, single stage with cast or fabricated volute casing. The volute casing is double volute to balance the radial load on shaft. The high efficiency impellers are casted type. The impeller can be semi open or enclosed type depending on operating head and application.

Double-suction pumps are employed when the flow rate required of a centrifugal pump becomes too large for the inlet cross-sections of one impeller or when the flow velocity in the inlet cross-section of the first impeller has to be reduced to prevent cavitation. In principle, fourfold or sixfold suction designs are possible.

Overview When the application calls for high-volume vertical pumps, the practical solution is the use of the Hazleton® vertical, double-suction, Twin-Volute VDS and VND. Designed for slurry handling in large volumes. The Twin-Volute casing design balances the radial loads created by the impeller and casing in the most efficient manner.
